阕 Not made with natural rubber latex

Do not use if package is opened or damaged

For use with a max peak voltage of 5600 V.

Indications for Use

electrosurgical accessories. The coated coagulation are normally used. where monopolar electrosurgical cutting and electrodes are intended for use in situations electrodes for use in conventional monopolar alternative to uncoated stainless steel The Edge Coated Electrodes are intended as an

Warning

This product cannot be adequately cleaned and/or sterilized by the user in order to facilitate safe reuse, and is therefore risks to the patient. incompatibility, infection, or product failure sterilize these devices may result in biointended for single use. Attempts to clean or

Danger: Explosion Hazard Do not use electrosurgery in the presence of flammable anesthetics.

Fire Hazard Both oxygen (O_2) and nitrous oxide (N_2O) support combustion. Watch for enriched O_2 and N_2O atmospheres near the surgery. Enriched O₂ atmospheres may result in fires and burns to patients or surgical site, especially during head and neck surgical personnel.

en

explosion hazards in the operating room: substances contribute to increased fire and Fire/Explosion Hazard The following

- Oxygen-enriched environments
- atmospheres Verify all anesthesia circuit

- Activate the electrosurgical unit only after vapors from skin prep solutions and tinctures have dissipated.
- (such as methane) that may accumulate in body cavities.

- Oxidizing agents, such as N₂O
- to prevent oxygen leaks. Verify endotracheal tubes are leak and during use of electrosurgery. connections are leak free before free and that the cuff seals properly
- If an uncuffed tube is in use, pack the uncuffed tube. throat with wet sponges around the
- If possible, stop supplemental oxygen at least one minute before and during use of electrosurgery.
- unctures Alcohol-based skin prepping agents and

patient or surgical personnel. seated electrode may result in burns to the securely into the pencil. An incorrectly The electrode must fit completely and

electrode in a clean, dry, insulated safety holster when not in use. Fire Hazard Always place the active Electrosurgical accessories that are

- unintended burns to the patient or activated or hot from use can cause surgical personnel.
- Electrosurgical accessories may cause fire gauze or surgical drapes. Place longer electrodes, such as extended electrodes, or burn if placed close to or in contact away from the patient and drapes. with flammable materials, such as

check the patient return electrode and all Confirm proper electrosurgical settings prior setting adjustments. accessory connections before major power to and during a procedure. Use the lowest power settings to achieve the desired effect. f increased power settings are requested,

minimize the risk, take these precautions: Burns to the surgeon's hands may result. To Some surgeons may elect to "buzz the hemostat" during surgical procedures. It is not recommended, and the hazards of such a practice probably cannot be eliminated

- Do not "buzz the hemostat" with a needle electrode.
- the retractors while buzzing the hemostat
- a lower voltage than coag.
- the minimum time necessary to achieve hemostasis.
- Firmly grasp as much of the hemostat as concentration at the fingertips. area and minimizes the current possible before activating the generator. This disperses the current over a larger

Do not lean on the patient, the table, or

instrument.

- Activate cut rather than coag. Cut has
- Use the lowest power setting possible for
- makes contact with the hemostat. Do not Activate the generator after the accessory arc to the hemostat.

Warning

- hands. alternate paths through the surgeon's close as possible to the patient) to reduce the opportunity for current to follow "Buzz the hemostat" below hand level (as
- electrode, place the edge of the electrode When using a coated or nonstick blade against the hemostat or other metal

injury or product damage. these power settings may result in patient stated in instructions for use. Exceeding Do not exceed maximum power limits as

of unintended burn injury. necessary in order to reduce the possibility the active electrode for the minimum time achieves the desired surgical effect. Use Always use the lowest power setting that

Precaution

Pediatric applications and/or procedures performed on small anatomic structures may require reduced power settings. The higher the current flow and the longer the current is applied, the greater the possibility of unintended thermal damage to tissue, especially during use on small appendages.

Needle electrodes are fragile. Handle them with care to avoid damage to the needle and injury to hospital personnel.

Before use, examine the electrosurgical unit and accessories for defects. Do not use

Do not modify or add to the insulation of active electrodes.

(cracked, burned, or taped) insulation

cables or accessories with damaged

or connectors.

Activate the electrosurgical unit **only** when ready to deliver electrosurgical current and the active tip is in view (especially if looking through an endoscope).

Deactivate the electrosurgical unit **before** the tip leaves the surgical site.

Precaution

The electrodes are intended for single use only. Safely discard after use to prevent injury to hospital personnel. These electrodes are not designed to withstand resterilization. Do not resterilize.

Needle electrodes are designed for precise low power use during monopolar electrosurgery. Using a needle at high power settings for extended periods of time may result in damage to the needle. Use low power settings for short periods of time to prevent needle damage.

This electrode has a coating to reduce sticking of eschar. Cleaning the electrode with a scratch pad or other abrasive object, scraping with a sharp object, or bending beyond 90 degrees may damage the electrode. If the electrode is damaged, discard it.

Notice

Using coated electrodes at high power settings may cause damage to the coating. If the coating is damaged, discard the electrode.

Electrosurgical generators (e.g., Force FX^m or Force EZ^m generators) produce desired surgical effects at lower power cut mode settings than conventional electrosurgical generators. The electrode coating may deteriorate when used with tissue response generators at higher power settings.

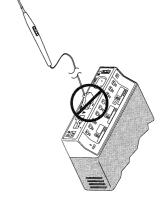

Important

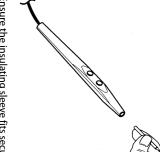

Wipe the electrode often with moist gauze or other material.

Instructions for Use

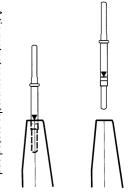

en

 Ensure the pencil is not connected to the generator.

3. Ensure the insulating sleeve fits securely inside the nose of the pencil so that the nose overlaps the insulating sleeve by at least 1/8" (0.3 cm).

5. A tip protector covers the coated end of some electrodes. If a tip protector is present, remove it before use.

Hex electrodes have a depth indicator. The line on the depth indicator should be flush with the tip of the handswitching pencil.

Maximum Power Maximum Power for Blades

The maximum power limits for E1455 series blades are as follows:

Pure Cut or Blend	Coag	Mode
50 watts	35 watts	Power Setting

Maximum Power for Needles

The maximum power limits for E1465 series needles are as follows:

Coag	Mode
25 watts	Power Setting

Pure Cut or Blend

30 watts
